### **Scientific career**

#### **SHORT DESCRIPTION**

Main subject of research was dose assessments of radon and its progeny with emphasis on beta and gamma radiation. For dose determining particle by particle transport codes were involved, such as PENELOPE and MCNP. Part of research was directed to determination of microdosimetric quantities and dose distributions on cell and sub cell scale levels, with tendency to model DNA damage and repair. Other field of research is nuclear technology, where albedo effect for photons of wide range of energies is main subject of interest. Another field of interest is gamma spectroscopy and developing suitable methods for measuring radon and its progeny airborne concentration. Recently there was emphasis to boron neutron capture therapy investigations.
